I have a a form that has a Dropdown list of topics and a text box. The user fills in his text and selects a topic. What is the best way to store this data? My first thought was to have a MySQL database with these two columns in it: Table: topics TopicID (int) TopicName (text) and then write a query to get the info for the user. SELECT * FROM topics WHERE TopicID = 10 And then I would have the user select the topic from a dropdown and then use javascript to post the form data to the server. But I'm sure that there's a better way to do this. How can I do it better? A: What I'd do is having a table named "Posts" that would hold all the fields of your user form, e ce6e30c18e
